1) The results presented represent annual average values for sampling conducted within SVOA's approved sampling program for 2025. The sampling program comprises approximately 1,200 samples per year. In 2025, 883 flushed samples were collected at the point of use, of which 36 were analyzed for the parameters in sample group B. Sampling and analysis are carried out several times per week, normally including at least one northern and one southern route in the distribution area.

The symbol '<' indicates 'less than'

2) Applicable limit values in the Swedish National Food Agency's Drinking Water Regulations (LIVSFS 2022:12) for treated drinking water.

3) The limit value defined by Stockholm Water and Waste for "no abnormal change" is 100 cfu/ml.

4) The limit value defined by Stockholm Water and Waste for "no abnormal change" is 550 cfu/ml.

5) There is no limit value for drinking water at the point of use. The noted limit value refers to treated drinking water.

6) Microcystin-LR is only analyzed at the point of use if detected in the raw water from Lake Mälaren.

7) The limit value defined by Stockholm Water and Waste for "no abnormal change" is 5.5 mg/l.

8) Results below the limit of quantification (LOQ) are reported as < LOQ.
